

VISIONAI DEVICE COMPARISON

AI Dashboard Cameras

Drivers and fleet managers gain access to real-time alerts for risky driving with the powerful combination of dual or single-lens AI dashcams and Driver Coach to improve safety and operational efficiency.

Dual-Camera Solution

Powerfleet is replacing its AI capable camera device with the next-generation VisionAI dashcam. The new device combines the road-facing and driver cameras into a single unit. A road-only facing camera option is available where an inward (driver/in-cab) camera is not required.

Combining the road and in-cab driver camera into a single, self-calibrating device, means fewer components to install. This makes the overall installation much quicker and reduces vehicle off-road time. It is smaller in physical size but boosts the same power and intelligence as its predecessor.

The device is changing but the features and functions within Unity stay the same.

What is different?

The innovative dual-facing camera is compact and smarter than ever before. The new dual-camera solution hosts a plethora of advantages for your fleet, such as:

Quicker installation
due to fewer components to install

Smaller in size

Self-calibrating ADAS AI

Build in function button offering functionality like privacy and Emergency

Single device featuring both road and driver/in-cab cameras
